

Ubique CV Consolidator — Setup Guide

Automatically copies files from every recruiter's OneDrive UBIQUE-WORKING FOLDER into one consolidated location, on a schedule, with no manual work.

Everything below is free: Microsoft Entra ID app registrations, the Graph API calls this script makes, and Windows Task Scheduler are all included with the Microsoft 365 licenses and Windows VM you already have. msal and requests are open-source.

Prerequisites

- Recruiters must be on **OneDrive for Business** (your company's Microsoft 365 tenant) — not personal/consumer OneDrive. This approach relies on tenant-level admin permissions, which don't exist for personal Microsoft accounts.
 - Someone with **Global Administrator** or **Application Administrator** rights in Microsoft 365 (often your IT admin) needs to do the one-time app registration and grant "admin consent" below. This step **cannot be skipped or worked around** — Microsoft deliberately requires an admin to approve any app that can read multiple users' files unattended.
 - A Windows VM with Python 3.9+ installed, and network access to graph.microsoft.com and login.microsoftonline.com.
-

Step 1 — Register an app in Microsoft Entra ID

1. Go to <https://entra.microsoft.com> → **Applications** → **App registrations** → **New registration**.
2. Name it something like Ubique CV Consolidator. Leave the default options. Click **Register**.
3. Note down the **Application (client) ID** and **Directory (tenant) ID** shown on the overview page.
4. Go to **Certificates & secrets** → **New client secret**. Create one, set an expiry (e.g. 12 months — you'll need to rotate it before then), and **copy the secret value immediately** (it's only shown once).

Step 2 — Grant API permissions

1. In the app, go to **API permissions** → **Add a permission** → **Microsoft Graph** → **Application permissions**.
2. Add:
 - **Files.Read.All** — lets the app read every recruiter's OneDrive files.
 - **Sites.ReadWrite.All** — lets it write into the Talent Vault SharePoint library.
3. Click **Grant admin consent for [your org]** — this button only works if you're an admin, or you'll need to ask one to click it. Without this, every API call the script makes will be rejected.

Security note: `Files.Read.All` is broad — it lets the app read any user's OneDrive in the tenant, not just the recruiters'. There's no narrower application-level permission for personal OneDrive access. Your IT/security team should be aware of this scope when approving it. Treat the client secret as a credential on par with an admin password — see Step 5.

Step 3 — Point it at Talent Vault

Files land in a folder inside the **Talent Vault** SharePoint document library, so the ATS tool your dev team built can pick them up from there as usual — this script only handles getting files *into* Talent Vault, not the parsing.

To do this you need Talent Vault's `site_id` (and its `drive_id`, so the script doesn't have to look it up on every run). Rather than hunting for these manually:

1. Finish Steps 1, 2, and 5 first (app registration + `pip install` + a `config.json` with just the tenant/client fields filled in — `site_id/drive_id` can stay as placeholders for now).

2. Run:

```
python find_site_id.py "Talent Vault"
```

3. It'll print the matching site's `site_id` and `drive_id`. Paste both into `config.json` under `destination_site_id` and `destination_drive_id`.
4. `destination_folder_path` controls the subfolder inside Talent Vault CVs get copied into (defaults to CVs from Recruiters) — change it if your dev team wants a specific folder name for the ATS to watch.

Step 4 — Configure the script

1. Copy `config.example.json` to `config.json` in the same folder as `consolidate_cvs.py`.
2. Fill in `tenant_id`, `client_id`, `client_secret` from Step 1.
3. List every recruiter's email under `recruiter_emails`.
4. Set `destination_mode` and the matching destination field from Step 3.
5. Adjust `allowed_extensions` if needed (defaults to common CV file types).

Step 5 — Install and test

On the Windows VM, open PowerShell:

```
pip install -r requirements.txt
python consolidate_cvs.py
```

Check `consolidate_cvs.log` in the same folder for what happened. Run it twice in a row — the second run should copy 0 new files, confirming duplicate-prevention works.

Protect `config.json` — it contains your client secret. Right-click the file → Properties → Security, and restrict read access to only the account that runs the scheduled task. Don't put this folder in a synced/shared OneDrive location itself.

Step 6 — Schedule it with Task Scheduler

1. Open **Task Scheduler** → **Create Task** (not “Basic Task”, so you get more options).
2. **General tab**: name it Ubique CV Consolidator. Choose “Run whether user is logged on or not”. Check “Run with highest privileges” if needed.
3. **Triggers tab** → New → Daily, at a time after recruiters have typically finished their downloads for the day (e.g. 8 PM). If you want the ATS to see new CVs sooner than once a day, set “Repeat task every: 1 hour” on the same trigger instead.
4. **Actions tab** → New:
 - Program/script: C:\Path\To\python.exe
 - Add arguments: consolidate_cvs.py
 - Start in: C:\Path\To\the\script\folder
5. **Conditions/Settings tabs**: uncheck “Stop if the computer switches to battery” (VM doesn’t have one anyway); check “If the task fails, restart every ...” for resilience.
6. Save, enter the credentials of the account that should run it when prompted.
7. Right-click the task → **Run** once to confirm it works under the scheduler (permissions/paths sometimes behave differently than an interactive PowerShell run).

That’s it — from here it runs unattended.

Notes on how it works

- The script authenticates as the **app itself**, not as any individual user, so it keeps working even if a recruiter changes their password or is out of office.
- Copies happen **server-side** (Graph tells Microsoft’s servers to move the file directly, drive-to-drive) — nothing is downloaded to the VM in transit, so it’s fast and doesn’t use your VM’s disk or bandwidth.
- A small local database (state.db) tracks what’s already been copied, so re-runs never duplicate files, and you can safely run it as often as you like.
- Files are renamed on arrival as `recruitername_YYYYMMDD_originalfilename.ext` so that two recruiters downloading a CV named Resume.pdf don’t collide or overwrite each other in the consolidated folder.

Things you may want to add later

- **Certificate-based auth** instead of a client secret — more secure, doesn’t expire as often, standard next step once this is running reliably.
- **Retry/backoff logic** for transient Graph API errors or throttling, if you scale to a lot of recruiters or files.
- **Alerting** (e.g. email itself on failure) so you notice if a run breaks instead of silently missing CVs — the log file above gives you what you need to wire that up.
